Four numbers that tell the truth about your practice

Production is not cash. These four ratios show where the gap is.

Run them from your practice-management reports once a month, split by payer. Compare against the same month last year, not against last month — one busy week hides a leak, a year does not.

COLLECTION RATE
95%+

Collected divided by expected production. This is the one that says whether the work you billed actually arrived.

ADJUSTMENT RATE
Under 5%

Contractual write-offs divided by total fees. Watch it climb faster than your visit count.

DAYS IN A/R
Under 40

Average age of everything still unpaid. Rising means follow-up is slipping, not that the work stopped.

A/R OVER 90 DAYS
Under 20%

Share of receivables older than three months. Past 120 days most balances are recoverable only with paperwork.

READ THEM TOGETHER, NOT ONE AT A TIME

- ☐ **Collection rate high, adjustments high:** you are discounting to look healthy. Re-price the fee schedule and re-open the weakest PPO contract.
- ☐ **Days in A/R rising, collection rate holding:** cash is arriving late, not never. That is a follow-up and attachment problem, not a payer problem.
- ☐ **Over-90 bucket growing while visits stay flat:** claims are dying quietly. Audit the oldest twenty balances and note why each one stalled.
- ☐ **Everything looks fine but the bank account does not:** compare collected to expected by payer. A single plan can absorb the difference across the rest of the book.

Where to pull each number: collection rate and adjustments come off the production and adjustment report; days in A/R and the over-90 bucket come off the aging report. Take them from the same report date every month so the trend is real.

Want these four run against your actual data?

We pull these four from your practice-management reports, by payer, and show you which one is costing the most.
